

BUSINESS REQUIREMENT DOCUMENT (BRD)

Tokopedia - Wishlist Feature

Project Name	Tokopedia Wishlist Feature Enablement	Created By	Jenna - Business Analyst, Tokopedia
Date	August 1, 2026	Version No.	1.0

Executive Summary

Tokopedia currently does not have a Wishlist feature that allows users to save products of interest without committing to an immediate purchase. Internal data shows that 34% of users exit a product detail page without checking out or saving the product - a gap that leaves Tokopedia trailing behind competitors such as Shopee and Lazada, which already offer similar functionality.

This project aims to build a Wishlist feature that lets users save products, receive notifications when prices drop or promotions become available, and access their saved items across devices. The feature is expected to increase the repeat purchase rate by 15% and reduce the exit-without-action rate on product pages from 34% to 20% within 3 months of release.

Background / Problem Statement

Tokopedia users currently have no official mechanism to save a product of interest for later purchase - the only available options are adding to cart or checking out immediately. As a result, many users resort to workarounds such as taking screenshots, or simply letting products pile up in their cart with no real intent to buy, which makes cart data less reliable as a purchase-intent signal. Internal data shows that 34% of users leave a product detail page without taking any action, and more than 40% of them search for the same product again within the following 7 days.

In addition, competitors such as Shopee and Lazada already offer a Wishlist feature integrated with promotional notifications as a retention driver. The absence of this feature at Tokopedia risks lowering engagement and repeat purchases, and weakens Tokopedia's competitive position on user experience.

Project Objectives

- Increase the user repeat purchase rate by 15% within 3 months of the Wishlist feature launch.
- Reduce the exit-without-action rate on product detail pages from 34% to 20% within 3 months.
- Increase conversion from promotional notifications on saved (Wishlist) products by 10% within 3 months.
- Reduce customer satisfaction survey complaints related to difficulty saving or retrieving products by 50% within 3 months of launch.

Project Scope

In-Scope

- Add a "Save to Wishlist" button (heart icon) on the product detail page and search results.
- A dedicated Wishlist page displaying all products the user has saved.
- Automatic notifications when a Wishlist product drops in price or enters a promotional period.
- Ability to remove products from the Wishlist.
- Wishlist synchronization across devices (mobile app and web) for logged-in users.

Out-of-Scope

- Sharing the Wishlist with other users or on social media.
- Organizing the Wishlist into custom folders/collections.
- AI-based product recommendations derived from Wishlist contents.
- Integration of the Wishlist with Tokopedia's loyalty/points program.

Current vs. Proposed Process

Current Process	Proposed Process
Users can only add a product directly to the cart or check out on the spot. There is no official mechanism to save a product of interest without buying it. As a result, users lose track of products they previously viewed and must search for them manually again, or products pile up in the cart with no clear buying intent - making cart data less reliable.	With the Wishlist feature, users can tap the heart icon on a product to save it without checking out. Saved products can be accessed anytime via the Wishlist page, and the system automatically sends a notification when a price drop or promotion occurs. This clearly separates “intent to save” from “intent to buy,” resulting in more accurate cart data and a more personalized shopping experience.

High-Level Requirements

High-Level Requirement	Priority	Description
Save to Wishlist button	High	The system must provide a heart icon on the product detail page and search results to save/remove products from the Wishlist.
Wishlist page	High	The system must provide a dedicated page displaying all products saved by the user, complete with current availability status and price.
Cross-device synchronization	High	Wishlist data must be synchronized in real time between the mobile app and web for logged-in users.
Price/promo change notifications	Medium	The system must send a push/email notification to users when a Wishlist product drops in price or enters a promotional period.
Stock status indicator	Medium	The system displays an “Out of Stock” label on Wishlist products that are no longer available, so users don't have mismatched expectations.
Quick add-to-cart from Wishlist	Low	The system provides an “Add to Cart” button directly on the Wishlist page, without needing to open the product detail page.

Project Constraints

Constraint	Description
Timeline	Target feature release in Q4 2026, aligned with the year-end peak season schedule.
Resource	Requires an allocation of 2 backend engineers, 1 frontend engineer, and 1 UI/UX designer, all of whom are currently committed to other projects.
Technical	Must be compatible with the existing product catalog system and notification engine, without degrading the performance of the main application.

Constraint	Description
Budget	Development budget is capped at the current quarter's allocation, with no additional external (outsourced) resources.

Key Stakeholders

Name	Role	Project Impact	Date of Acknowledgement
Lena	Project Manager	Runs the project and ensures it stays aligned with business targets.	August 3, 2026
John	Technical Lead	Leads backend development and data synchronization.	August 4, 2026
Grace	UI/UX Design Lead	Ensures the Wishlist feature's user experience meets requirements.	August 4, 2026
Jenna	Business Analyst	Drafts requirements, ensures cross-team alignment, and follows up on execution.	August 1, 2026
